

RLS in Embedding

we can directly define RLS when creating guesttoken

```
public function getGuestToken()
{
    $token = $this->login();

    $response = Http::withHeaders([
        'Content-Type' => 'application/json'
    ])->log()
    ->withToken($token)
    ->post("{ $this->baseUrl}/api/v1/security/guest_token", [
        'user' => [
            'username' => "",
            'first_name' => "",
            'last_name' => ""
        ],
        'resources' => [
            [
                'type' => 'dashboard',
                'id' => $this->dashboardId
            ]
        ],
        'rls' => [
            ['clause'=> 'fakultas = "Fakultas Kedokteran"']
        ],
    ]);

    if ($response->successful()) {
        return $response->json('token');
    }

    throw new \Exception('Failed to get guest token: ' . $response->body());
}
```
